

Remediation Planning With the CyCognito Platform

Efficiently Plan and Measure Security Posture Improvement

The Remediation Planner is an intelligent, interactive tool within the CyCognito Platform that guides security and IT teams about how to prioritize and focus your remediation efforts to achieve the greatest security posture improvement with the least effort.

At a time when security and IT teams have more security issues than people to fix them, you can quickly prioritize which assets and issues to fix first and which to address later, based on your organization's goals.

Your remediation plan can be tailored to your security posture improvement goals based on security grades or issue severity. Do you want to improve your security grade from a D to a B? The Remediation Planner can show you how to do it. It can also be scoped broadly across the entire organization or more focused on specific subsidiaries, locations, environment types, platforms, or issues like vulnerabilities or CVEs that your organization cares about.

Your plan can be exported with the prioritized list of assets and issues, the required effort to address them, and what impact its execution will have on your overall security score. To make progress tracking easy, the platform monitors your attack surface for remediation activity and automatically creates a dashboard showing progress for the issues in your plan's scope in the Progress Tracker section of the Remediation Planner.

BENEFITS

- Easily set goals or focus areas for improvement
- The platform intelligently and automatically prioritizes issues to be fixed
- Measure and track remediation toward the goal (and specific improvements)

"It's kinda brilliant!"

Security analyst, public sector agency

"It helps us manage the risk to our business,"

CISO, entertainment and gaming company

"This will help us address the AWS/Cloudfront issues we see today. It will allow us to break up the issues quickly to speed remediation,"

CISO and Chief Privacy Officer, healthcare company

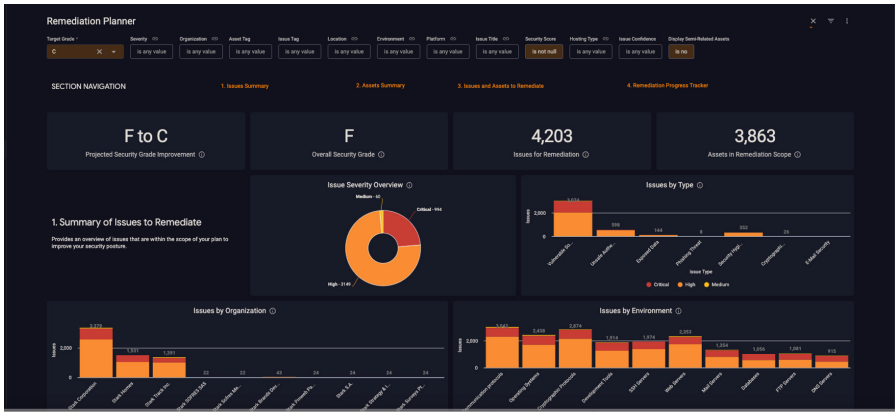

Figure 1: The Remediation Planner shows you where to focus your remediation efforts to achieve your security improvement goals. Here, CyCognito has highlighted that Unsafe authentication is a particularly prevalent issue.

Another Key Element in the CyCognito Approach to Efficient Remediation

The Remediation Planner helps you streamline your attack surface protection processes and augments other platform capabilities. With workflow integrations with other solutions, expert remediation guidance, and automatic remediation validation, CyCognito helps security and IT teams reduce attack surface risks in a closed-loop process.

The CyCognito platform offers a number of dashboards to help you analyze and improve your security posture. For example, there is a complementary Remediation Performance Tracking Dashboard that provides you with the ability to track and compare the remediation performance of different organizational groups in your enterprise.
